QuestionAnswer What are the key Maths formulae to remember for EAMCET exams? Some essential Maths formulae include the quadratic formula, distance formula, midpoint formula, area and volume formulas for various shapes, and trigonometric identities like $\sin^2\theta + \cos^2\theta = 1$. Memorizing these helps solve problems efficiently during the exam. How is the quadratic formula derived and how can I use it with an example? The quadratic formula $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ is derived by completing the square for $ax^2 + bx + c = 0$. For example, for $2x^2 + 3x - 2 = 0$, $a=2$, $b=3$, $c=-2$. Plugging in: $x = \frac{-3 \pm \sqrt{9 - 4(2)(-2)}}{4} = \frac{-3 \pm \sqrt{9 + 16}}{4} = \frac{-3 \pm \sqrt{25}}{4}$. So, $x = \frac{-3 \pm 5}{4}$, giving $x = \frac{2}{4} = 0.5$ or $x = \frac{-8}{4} = -2$. What is the formula for the area of a triangle using Heron's formula? Heron's formula states that the area of a triangle with sides a , b , and c is $\sqrt{s(s-a)(s-b)(s-c)}$, where $s = \frac{a+b+c}{2}$ is the semi-perimeter. For example, if $a=5$, $b=6$, $c=7$, then $s=9$. $\text{Area} = \sqrt{9(9-5)(9-6)(9-7)} = \sqrt{9 \cdot 4 \cdot 3 \cdot 2} = \sqrt{216} \approx 14.7$. How do I apply the distance formula with an example? The distance formula between two points (x_1, y_1) and (x_2, y_2) is $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$. For example, between $(1, 2)$ and $(4, 6)$: $\sqrt{(4-1)^2 + (6-2)^2} = \sqrt{3^2 + 4^2} = \sqrt{9 + 16} = \sqrt{25} = 5$. What is the formula for the sum of an arithmetic series? The sum of the first n terms of an arithmetic series is $S_n = \frac{n}{2} (2a + (n-1)d)$, where a is the first term and d is the common difference. For example, sum of first 5 terms with $a=2$ and $d=3$: $S_5 = \frac{5}{2} [2(2) + (5-1)3] = 2.5 [4 + 12] = 2.5 \cdot 16 = 40$. How do I use the sine rule with an example? The sine rule states that $\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$. For example, in a triangle with sides $a=7$, $b=9$, and angle $A=30^\circ$, to find angle B : $\frac{b}{\sin B} = \frac{a}{\sin A} \Rightarrow \frac{9}{\sin B} = \frac{7}{\sin 30^\circ} \Rightarrow \frac{9}{\sin B} = \frac{7}{0.5} \Rightarrow \frac{9}{\sin B} = 14$. Solving for $\sin B$: $\sin B = \frac{9}{14} \approx 0.643$. Then, $B \approx \sin^{-1}(0.643) \approx 40^\circ$. What is the volume formula for a cylinder, and can you give an example? The volume of a cylinder is $V = \pi r^2 h$, where r is radius and h is height. For example, if $r=3$ cm and $h=10$ cm, $V = \pi(3)^2 10 \approx 9 \cdot 3.14 \cdot 10 = 282.74$ cubic centimeters. How can I remember the basic trigonometric identities for exams? Key identities include $\sin^2\theta + \cos^2\theta = 1$, $1 + \tan^2\theta = \sec^2\theta$, and $1 + \cot^2\theta = \csc^2\theta$. Remembering these helps simplify problems involving trigonometric functions. For example, if $\sin\theta = \frac{3}{5}$, then $\cos\theta = \frac{4}{5}$, using the Pythagorean identity.

Trigonometric Identities

- $\sin^2 \theta + \cos^2 \theta = 1$
- $\tan \theta = \sin \theta / \cos \theta$
- $1 + \tan^2 \theta = \sec^2 \theta$
- $1 + \cot^2 \theta = \csc^2 \theta$

Laws of Sines and Cosines

- Law of Sines: $(a / \sin A) = (b / \sin B) = (c / \sin C)$
- Law of Cosines: $c^2 = a^2 + b^2 - 2ab \cos C$

Mensuration

Mensuration deals with measuring the volume and surface area of solid objects.

Volume and Surface Area of Common Solids

- Sphere: Volume = $(4/3)\pi r^3$; Surface area = $4\pi r^2$
- Cylinder: Volume = $\pi r^2 h$; Surface area = $2\pi r(h + r)$
- Cone: Volume = $(1/3)\pi r^2 h$; Surface area = $\pi r(l + r)$
- Rectangular Prism: Volume = $l \times b \times h$; Surface area = $2(lb + bh + hl)$
- Cube: Volume = a^3 ; Surface area = $6a^2$

Coordinate Geometry

This branch involves plotting points and understanding geometric relationships on the Cartesian plane.

Distance Between Two Points

$$- d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Midpoint Formula

$$- \text{Midpoint (M): } ((x_1 + x_2)/2, (y_1 + y_2)/2)$$

Equation of a Line

- Slope-intercept form: $y = mx + c$
- Point-slope form: $y - y_1 = m(x - x_1)$

Statistics and Probability

Statistics involves data analysis, while probability assesses the likelihood of events.

Measures of Central Tendency

- Mean: Sum of values / number of values
- Median: Middle value when data is ordered

- Mode: Most frequently occurring value

Measures of Spread

- Range: Maximum value - minimum value
- Variance: Average of squared deviations from the mean
- Standard Deviation: Square root of variance

Probability

- Probability of an event (E): Number of favorable outcomes / total outcomes
- Complement rule: $P(\text{not } E) = 1 - P(E)$
