Understanding Network Programming

What is Network Programming?

Network programming involves writing software that enables computers and devices to communicate over a network. It encompasses the creation of client-server applications, peer-to-peer systems, and web-based services. The goal is to facilitate efficient, reliable, and secure data exchange between distributed systems. In the context of Anna University's MC9241 course, network programming focuses primarily on socket programming, which is the foundation for most networked applications.

Socket Programming Explained

Sockets serve as endpoints for sending and receiving data across a network. They provide a programming interface that allows developers to implement communication protocols at the application level. Socket programming can be performed in various languages, with C and Java being prominent choices in university courses.

Types of Sockets

- **Stream Sockets (TCP):** Provide reliable, connection-oriented communication. Suitable for applications requiring guaranteed data delivery, such as web browsing and email.
- **Datagram Sockets (UDP):** Offer connectionless communication with minimal overhead. Used in real-time applications like video streaming and online gaming where speed is critical.

Practical Aspects of MC9241 Network Programming

Setting Up a Network Application

- **Creating a Socket:** Establishing an endpoint for communication.
- **Binding:** Associating the socket with a specific IP address and port number.
- **Listening and Accepting:** For server applications, waiting for incoming client connections.
- **Connecting:** For client applications, establishing a connection to the server.
- **Data Transmission:** Sending and receiving data through the socket.
- **Closing the Socket:** Properly terminating the connection to free resources.
